

KNB to commence aggressive 10,000m drilling program at Enmore Gold Project, NSW

HIGHLIGHTS

Koonenberry Gold will commence 10,000m Phase II drilling at the Enmore Gold Project in northeast NSW in the next few days with crews having been mobilised to site. Drilling has been planned to target:

- **Extensions to mineralisation at Sunnyside** testing up dip and down dip positions, as well as along strike to the east where the mineralisation remains open. This work will look to extend the broad and high-grade results intersected during phase I drilling including:
 - **170m @ 1.75g/t Au** from 77m, inc. **18.3m @ 9.95g/t Au** from 172.9m (25ENDD002).¹
 - **172.9m @ 2.07g/t Au** from 171m, inc. **25m @ 5.23g/t Au** from 194m (25ENDD002).²
 - **102m @ 1.10g/t Au** from 184m, inc. **44m @ 1.77g/t Au** from 235m, incl. **9.7m @ 3.57g/t Au** from 252.3m (25ENDD003).³
 - **107m @ 1.14g/t Au** from 189m inc. **80.5m @ 1.45g/t Au** from 193.5m, inc. **35.5m @ 1.94g/t Au** from 210.5m, inc. **9.7m @ 3.18g/t Au** from 210.5m (25ENDD006).⁴
- **Discovery drilling along the 2km prospective Sunnyside Shear Zone** where four priority drill targets have been identified that potentially represent repetitions.
- KNB is well funded to execute this exciting program and continue exploration across its projects with **\$8.7M cash**.⁵

Figure 1. Zoomed out Long Section viewed towards 340°. A gold and arsenic soil anomaly sits over the top of the Sunnyside mineralisation. To the east, similar gold and arsenic soil anomalies with high-grade rock chips⁶ provide compelling drill targets. **Limited wide-spaced, relatively shallow drilling in this area has returned anomalous gold highlighting the potential for additional discoveries.** Note planned drill target areas are subject to changes due to various factors including ongoing geological assessment and review

KNB Managing Director Dan Power commented:

*“Our first phase of drilling at Sunnyside produced some exceptional results which point to a **significant emerging gold discovery story with standalone bulk tonnage potential as well as high-grade gold at depth.***

*The mineralised zone has been shown to extend from surface to +300m vertically, over an estimated ~75m true width and along ~260m strike. **Phase two drilling will look to extend the mineralised zone up dip, down dip and along strike, particularly towards the east.***

*In addition, **discovery drilling will test priority targets along the 2km prospective shear zone from Sunnyside to Hand in Hand where we see potential for repetitions of “Sunnyside-style” gold mineralisation.** Four target areas have been defined with coincident gold and arsenic soil anomalies, favourable geology and structures at the contact between the granite and sediments. High-grade rock chips up to 17.55g/t Au and limited historical drilling with anomalous gold add to the prospectivity of these targets.*

This is an exciting time for Koonenberry shareholders and we look forward to building on the success of our phase one drilling with results demonstrating the potential scale, grade and upside of this emerging discovery story.”

Figure 1. Sunnyside long section indicating mineralisation remains open in multiple directions. Pierce points include all KNB Phase I drilling as well as Okapi down hole intersections of >2g/t x m (plotted at the midpoint of the intersection and coloured by down hole gram metres). **Phase II drilling will target extensions to mineralisation up dip, down dip and along strike to the east.**

Figure 3. Sunnyside to Hand in Hand Gradient Array Induced Polarisation (GAIP) with interpreted Sunnyside Shear Zone (first order structure) and tangential faults (second order structures) and gold in soil anomalies and priority drill targets. **Drill targets are defined by coincident structure** (Sunnyside Shear Zone, or secondary structures and dilational sites), geochemistry (**gold and arsenic in soils**), host rock (**preferred granite host**) and resistivity low (interpreted **alteration**).

Figure 4. Sunnyside to Hand in Hand Gradient Array Induced Polarisation (GAIP) with interpreted Sunnyside Shear Zone (first order structure) and tangential faults (second order structures), arsenic in soil anomalies and priority drill targets. **Drill targets are defined by coincident structure** (Sunnyside Shear Zone, or secondary structures and dilational sites), geochemistry (**gold and arsenic in soils**), host rock (**preferred granite host**) and resistivity low (interpreted **alteration**).

FORWARD PROGRAM

In its first phase of drilling at Enmore, Koonenberry Gold intersected extensive intervals of gold mineralisation from surface as well as high-grade gold intervals at depth. Gold mineralisation has been intersected over an estimated ~75m true width, 300m vertical depth extent and ~260m strike extent in results to date. The mineralisation remains open up dip, down dip and along strike to the NE and SW in the preferred granite host rock along the Sunnyside Shear Zone.

Phase two drilling is expected to exceed 10,000m. This aggressive campaign is scheduled to run into 2026 with results to be reported as they become available during this time.

Additional soil sampling has also been conducted along the Borah Fault, a parallel shear zone to the Sunnyside Shear Zone with very encouraging results that will require further investigation and drill testing.

Koonenberry Gold has a diverse portfolio of high-quality gold and copper projects in highly prospective areas of NSW and plans to prioritise programs to maximise value for its shareholders. The Company looks forward to providing regular exploration updates as this work progresses.

SUNNYSIDE PROSPECT BACKGROUND

The Sunnyside Prospect occurs along the Sunnyside Shear Zone, which is associated with the development of a penetrative, strongly foliated, mylonitic fabric near the contact between the Permo-Carboniferous (302Ma) porphyritic quartz monzogranite (locally called granite for simplicity) to the north and sedimentary rocks of the Gिरrakool Beds to the south. Deformation of the granite has occurred at biotite-grade metamorphic conditions. The prospect has seen a modest amount of near-surface historical exploration, with deeper drilling only conducted in recent years. This has resulted in the discovery of significant gold mineralisation over extensive widths as well as high grade zones at depth.

Gold mineralisation is orogenic epizonal in character and is structurally controlled along the NE-SW trending shear zone and in later quartz and iron carbonate veins which can crosscut the shear zone at high angles to the shear fabric. The shear zone dissects and locally fault bounds the granite intrusions.

Mineralisation is largely hosted within the granite and appears to be long-lived and multi staged with gold occurring in silicified breccias, quartz stockworks, sulphidic veins, iron carbonate vein arrays and narrow quartz veins. An early gold event is associated with strong shearing, pervasive silicification and sericitisation with sulphides emplaced along the NE-SW trending shear zone. Multiple overprinting events have introduced gold in iron carbonate vein arrays and quartz veins developed within extensional fracture zones which can be tangential or oblique to the main structure.

This structural setting and paragenesis may be similar to the 1.7Moz Hillgrove deposit, located just 20km to the north, where the main mineralisation is hosted within a conjugate vein array between the Hillgrove and Chandler fault systems rather than along the main shear.⁷ For the most part, drilling at Sunnyside has been conducted orthogonal to the main shear zone rather than targeting high-grade shoots oblique to those structures.

Discrete mineralised zones are generally defined by intense alteration including a mineral assemblage of sericite, iron carbonate, potassium feldspar (adularia), quartz (crystalline and drusy), free gold, pyrite, arsenian pyrite, minor arsenopyrite and local traces of chalcopyrite, sphalerite, galena and tetrahedrite. The occurrence of adularia is considered to define hydrothermal fluid chemistry and process (ie. potassium bearing) rather than defining a classification of mineral system other than orogenic-type.

Gold mineralisation is typically associated with pyrite, arsenian pyrite and arsenopyrite. Arsenic assays tend to have a linear correlation with gold values except for late stage high-grade drusy quartz ±adularia veins, where there may be no sulphides and therefore low arsenic. It is unclear how much gold is in solid solution with the sulphides. Other sulphides are not common at hand specimen scale, although antimony is anomalous in surface soil samples.

Koonenberry Gold's first drill program delineated mineralisation extending away from the granite-sediment contact for ~75m in true width, ~260m along strike and from surface to over 300m vertically. Gold mineralisation remains open in multiple directions, including along the Sunnyside Shear Zone, with indications that grade may be increasing with depth.

⁷ Downes, P. M., 2017

ABOUT KOONENBERRY GOLD

Koonenberry Gold Ltd is a minerals explorer aiming to create value for shareholders through the discovery of Gold and Copper across its diverse portfolio of highly prospective and strategically located projects. These projects cover an area of 4,360km² making it one of the most significant exploration portfolios in NSW. The Company's main focus is the Enmore Gold Project, which is at an exciting discovery phase with drilling returning broad intervals of gold mineralisation extending from surface as well as high-grade gold zones at depth.

Competent Persons Statement

The information in this announcement that relates to Exploration Results is based on information compiled under the supervision of Mr Paul Wittwer, who holds a BSc Geology (Hons.), is a Member of the Australian Institute of Geoscientists (AIG) and the Australian Institute of Mining and Metallurgy (AusIMM) and is the Exploration Manager of Koonenberry Gold Limited. Mr Wittwer has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves.' Mr Wittwer consents to the inclusion in this report of the matter based on his information in the form and context in which it appears. Where reference is made to previous announcements of exploration results in this announcement concerning the Company's projects, the Company confirms that it is not aware of any new information or data that materially affects the information and results included in those announcements. The information in this announcement that relates to the previous exploration results have been cross referenced to the original announcement or are from the announcements listed in the references table.

Forward looking statements

This announcement may include forward looking statements and opinion. Often, but not always, forward looking statements can be identified by the use of forward looking words such as "may", "will", "expect" "intend", "plan", "estimate", "anticipate", "continue", "outlook" and "guidance" or other similar words and may include, without limitation, statements regarding plans, strategies and objectives of management, anticipated production or construction commencement dates and expected costs or production outputs. Forward looking statements are based on Koonenberry and its Management's good faith assumptions relating to the financial, market, regulatory and other relevant environments that will exist and affect Koonenberry's business and operations in future. Koonenberry does not give any assurance that the assumptions on which forward looking statements are based will prove to be correct, or that Koonenberry's business or operations will not be affected in any material manner by these or other factors not foreseen or foreseeable by Koonenberry or Management or beyond Koonenberry's control. Although Koonenberry attempts and has attempted to identify factors that would cause actual actions, events or results to differ materially from those disclosed in forward looking statements, there may be other factors that could cause actual results, performance, achievements or events not to be as anticipated, estimated or intended, and many events are beyond the reasonable control of Koonenberry. Accordingly, readers are cautioned not to place undue reliance on forward looking statements. Forward looking statements in these materials speak only at the date of issue. Subject to any continuing obligations under applicable law in providing this information Koonenberry does not undertake any obligation to publicly update or revise any of the forward-looking statements or to advise of any changes in events, conditions, or circumstances on which any such statement is based.

Cautionary statement on visual estimates of mineralisation

Any references in this announcement to visual results are from visual estimates by qualified geologists. Laboratory assays are required for representative estimates of quantifiable elemental values. Visual estimates of mineral abundance should never be considered a proxy or substitute for laboratory analyses where concentrations or grades are the factor of principal economic interest. Visual estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations.

Proximate statements

This announcement may contain references to Mineral Resources, mines and exploration projects of other parties either nearby or proximate to Koonenberry Gold's projects and/or references that may have topographical or geological similarities to Koonenberry Gold's projects, the Enmore Gold project and / or Lachlan projects. It is important to note that such discoveries or geological similarities do not in any way guarantee that the Company will have any success at all or similar successes in delineating a Mineral Resource on any of Koonenberry Gold's projects, the Enmore Gold project and / or Lachlan projects.
