

Shallow, thick and high-grade Manganese continues across the Wandanya Discovery

- Assay results from manganese targeted drilling at Wandanya confirm consistent shallow, thick and high-grade mineralisation strikingly similar to W2 discovery located almost 2km to the south.
- Significant Phase 2 drill assay results include:
 - **6m @ 35.0% Mn** from surface including **3m @ 42.1% Mn** from 3m (WDRC095)
 - **7m @ 29.7% Mn** from surface including **3m @ 42.4% Mn** from 4m (WDRC096)
 - **8m @ 28.5% Mn** from surface including **3m @ 43.2% Mn** from 4m (WDRC097)
 - **8m @ 28.4% Mn** from 2m including **3m @ 38.5% Mn** from 7m (WDRC037)
 - **5m @ 28.7% Mn** from 9m including **2m @ 43.5% Mn** from 11m (WDRC041)
 - **6m @ 28.4% Mn** from surface including **2m @ 41.9% Mn** from 4m (WDRC106)
 - **6m @ 29.2% Mn** from surface including **3m @ 43.1% Mn** from 3m (WDRC107)
 - **5m @ 29.3% Mn** from surface including **2m @ 45.8% Mn** from 3m (WDRC113)
- The latest results are located 350m south of previously fast-tracked reported intersections¹:
 - **8m @ 31.1% Mn** from 5m including **3m @ 41% Mn** from 10m (WDRC063)
 - **4m @ 29.8% Mn** from 12m (WDRC069)
- The latest results **demonstrate manganese mineralisation continues at least 2km north of the original W2 discovery** with cross strike widths ranging between 250m and 450m, **remaining open to the north and east.**
- Further assays from the remaining 47 drillholes targeting high-grade iron and manganese are expected to be finalised by the end of August 2025.
- Phase 3 RC drilling to extend and further delineate the manganese and iron discoveries along a total strike of **3km and up to 800m cross width** to commence mid-August 2025.

Australian manganese explorer and developer, Black Canyon Limited (**Black Canyon or the Company**) (**ASX: BCA**) is pleased to announce assay results from manganese targeted samples as part of the Phase 2 RC drilling¹ program at Wandanya, WA. The results confirm the scale potential of the Wandanya Project (BCA 100%) with consistent thickness, grade and geology of the shallow stratabound manganese mineralisation continuing over at least a 2km strike.

Balfour Manganese* Field Highlights

Global MRE of 314Mt @ 10.5% Mn.
 Largest Resource in Western Australia.
 Development Options – Traditional Mn concentrate or HPMSM processing for EV's.

*BCA Announcement 12/12/23

Black Canyon's Managing Director Brendan Cummins said:

"The latest batch of assay results from the manganese targeted drill holes continue to demonstrate the significant potential of the Wandanya discovery for the Company and its shareholders."

"The stratabound manganese mineralisation discovered is both shallow and exceptionally consistent in grade and thickness, which is unique to the region and timely in terms of delivering a potential future supply of high-grade manganese oxide from Australia."

"I think it's fair to say that over the past 50 years only three significant manganese deposits have been discovered in Australia, being Groote Eylandt, Woodie Woodie and Bootu Creek, which have all been successfully brought into production."

"Whilst it's early days for Wandanya, the results received from our initial drill programs provide much confidence that we have discovered a significant mineral system with many of the attributes such as grade, scale, thin overburden and the ability to produce a high-quality manganese concentrate required for a potential mine development."

"We look forward to receiving more Phase 2 RC manganese results along with the high-grade iron results over the next few weeks. Phase 3 drilling, to continue defining the extents of the Wandanya manganese and iron discoveries, is planned to commence in mid-August."

Figure 1. Cross section 7,525,420mN looking to the north showing the location of RC drill holes with shallow high-grade manganese mineralisation (4x Vertical Exaggeration).

Manganese Assay Results

The Phase 2 RC drill program completed at Wandanya totalled 101 holes for 2,300m of drilling with drill line spacing ranging between 100m and up to 350m, and hole centres at 40m. Assay results and associated quality control/assurance (QAQC) data has been received and approved for holes WDR037 to WDR043, and WDR072 to WDR114, which are primarily manganese targeted drill holes (final results for the remaining 47 drillholes are expected by the end of August).

The reported holes are located within the southern area of the Northern Manganese Corridor and confirm mineralisation along strike between 350m to 400m with cross width manganese mineralisation between 150m and 250m and open to the east. The latest assay results are located approximately 1,750m from the original Wandanya – W2 discovery and 350m south of previously reported¹ intersections that include:

- **8m @ 31.1% Mn** from 5m including **3m @ 41%Mn** from 10m (WDRC063)
- **4m @ 29.8% Mn** from 12m (WDRC069)

In summary, the combined drill assay results demonstrate manganese mineralisation along 2km of strike with widths ranging between 150m and 450m. The average thickness of the reported drill intersects is approximately 5m with a consistent high-grade footwall of ~40% Mn and a lower grade hangingwall grade of ~20% Mn with an average drill intersect grade of approximately 29% Mn. The geology is shallowly dipping to the east, and the mineralisation remains open on multiple drill lines.

Cross-sections and drill plans are presented in Figures 1-4. Significant manganese assay results are presented in Table 1 and all assay results are presented in Appendix 2.

Table 1. Significant assay results from the June 2025 Phase 2 drill program.

HOLE ID	E_GDA94	N_GDA94	RL	EOH	DIP	AZIMUTH	DRILL INTERSECTION

WDRC108	323036	7525325	398	18	-90	360	4m @ 31.5% Mn & 3% Fe from 3m
WDRC113	322997	7525202	402	20	-90	360	5m @ 29.3% Mn & 3.3% Fe from 0m including 2m @ 45.8% Mn & 1.9% Fe from 3m
WDRC114	323041	7525202	399	20	-90	360	6m @ 19.6% Mn & 3.5% Fe from 2m including 2m @ 32.5% Mn & 4.2% Fe from 5m

Figure 2. Wandanya Phase 1 (W2), Phase 2 RC drill holes coloured by commodity target and planned Phase 3 RC drill collars.

Figure 3. Wandanya Phase 2 RC drill holes assay results from the Northern Manganese Corridor. Red text boxes were previously reported¹. Refer to Appendix 2 for further information.

Figure 4. Cross section 7,525,900mN looking to the north showing the location of previously released¹ RC drill holes WDRC057, WDRC063 and WDRC06 (4x Vertical Exaggeration). Note assays pending for other holes.

Metallurgical testwork^{2,3} completed on W2 stratabound manganese mineralisation has shown composite samples **averaging 30% Mn** can be beneficiated using density-based separation which **achieved a 45% Mn product grade** exceeding the premium 44% Mn benchmark grade (Table 2).

Table 2. Heavy Liquid Separation (HLS) testwork results from the W2 moderate and high-grade composites^{2&3}.

Composite	Sample type	Head grade feed Mn (%)	Size fraction	HLS Results						
				Density Parameter	Mn (%) Conc	Mn Stage Rec (%)	Mn (%) ave Conc	Mn overall Conc rec (%)	Combined Mn (%) Conc	Combined overall Conc rec (%)
WD01LG	RC chip composite	21.2	+1.0mm - 10mm	SG 2.85	39.6	88.6	39.5	77.9	44.8	79.5
			-1.0mm +0.045mm		39.3	93.6				
WD02HG	RC chip composite	41.5	+1.0mm - 10mm	SG 2.85	49.4	99.0	50.1	81		
			-1.0mm +0.045mm		50.8	99.0				

Next Steps

Remaining assay results for both manganese and iron are expected by the end of August.

Phase 3 RC drilling is set to commence in mid-August with a planned program of 3,500m to extend the current drill coverage to the north and infill the current drill line to test the entire 3km of mapped manganese and iron mineralisation.

About Black Canyon

Black Canyon has consolidated a significant land holding totalling 2,300km² in the underexplored Balfour Manganese Field (BMF) and across the Oakover Basin, in Western Australia.

The Company holds several exploration licenses 100% within the BMF along with a 75% interest in the Carawine Joint Venture with ASX listed Carawine Resources Limited. A Global Mineral Resource (Measured, Indicated & Inferred) of 314 Mt @ 10.4% Mn has been defined across the Balfour Manganese Field projects. This MRE comprises 100Mt @ 10.4% Mn (Measured), 150Mt @ 10.1% Mn (Indicated) and 64Mt @ 11.9% Mn (Inferred) – refer to ASX release 12 Dec 2023.

Wandanya Discovery represents a new exploration model on the eastern margin of the Oakover Basin comprising hydrothermal, stratabound

high-grade manganese and high-grade iron with significant scale and grade potential.

Manganese continues to have attractive long-term fundamentals where it is essential and non-substitutable in the manufacturing of alloys for the steel industry and a critical mineral in the cathodes of Li-ion batteries.

Compliance Statements

Reporting of Exploration Results and Previously Reported Information

The information in this report that relates to Exploration Results is based on, and fairly represents, information and supporting documentation reviewed by Mr Brendan Cummins, Managing Director of Black Canyon Limited. Mr Cummins is a member of the Australian Institute of Geoscientists, and he has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which has been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves”. Mr Cummins consents to the inclusion in this release of the matters based on the information in the form and context in which they appear. Mr Cummins is a shareholder of Black Canyon Limited.

For further information, please refer to ASX announcements dated 14 February 2023, 27 March 2023, June 1 2023, June 14 2023, June 17 2023, July 14 2023, 23 August 2023, 5 September 2023, 26 September 2023, 12 October 2023, 27 November 2023, 12 December 2023, 26 March 2024, and 1 May 2024, 2 July 2024, 21 August 2024, 25 September 2024, 27 September 2024, 8 October 2024, 18 October 2024, 14 November 2024, 27 November 2024, 4 December 2024, 23 December 2024 and 11 February 2025, 1 April 2025, 16 April 2025, 1 May 2025, 30 June 2025 and 7 July 2025 which are available from the ASX Announcement web page on the Company’s website.

The Company confirms that it is not aware of any new information or data that materially affects the information included in this release that relate to Exploration Results and, in the case of mineral resource estimates, that all material assumptions and technical parameters underpinning the estimates in the relevant release continue to apply and have not materially changed.

APPENDIX 1: JORC 2012: TABLE 1

Section 1 Sampling Techniques and Data		
Criteria	Explanation	Comment
Sampling techniques	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	<i>Reverse circulation ('RC') was used as the primary drilling technique for the projects.</i> <i>RC cuttings were continuously sampled at 1 m intervals. All drill holes were sampled and logged from surface to end of hole or depth of mineralisation.</i> <i>Drilling completed by Black Canyon has been used for the projects.</i> <i>All drill samples were logged for weathering, colour, lithology and mineralogy.).</i> <i>RC samples were collected and placed in marked green plastic bags in order at each collar position.</i> <i>The 1m interval samples are considered industry standard and representative of the material being tested.</i> <i>There was limited water encountered during the drill program.</i> <i>The drilling and sample techniques are considered representative for the style of mineralisation utilising 1m sample intervals</i> <i>The target sample weight was between 2-3kg which is appropriate for the style of mineralisation</i>
Drilling techniques	<i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	<i>Black Canyon drilling was completed using RC technique at 90-degree angle to collect 1 m samples as RC chips. Drill diameter is 5.25 inches as per standard RC sizing. A face sampling hammer was used to drill and sample the holes.</i> <i>The Company contracted Impact Drilling who sub-contracted Drillwest for the June 2025 drill campaign.</i>

<i>Drill sample recovery</i>	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	<i>The 2025 drill campaign recorded satisfactory drill sample recovery. The sample weights were not recorded on site, but the samples were weighed once received at the laboratory. The samples weights show good overall recoveries with smaller samples weights recorded in the top 1-2m.</i> <i>During the 2025 drill program the 1m samples were collected from a levelled cone splitter affixed to the side of the drill rig.</i> <i>It is unlikely the lower weights encountered in the top 1 - 2m of the holes has biased the samples particularly with the style of mineralisation.</i> <i>The samples were drilled mostly dry minimising sample bias</i>
<i>Logging</i>	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i>	<i>Geological logs exist for the June 2025 drill program.</i> <i>Logging of individual 1 metre intervals was completed using logging code dictionary which recorded weathering, colour, lithology and observed commentary to assist with determining manganese mineralisation.</i> <i>Logging and sampling has been carried out to industry standards.</i> <i>Drill holes were geologically logged in their entirety, and a reference set of drill chips were collected in 20m interval chip trays for the drill program. The chip trays were all photographed on site at the end of drilling each hole.</i> <i>All metres drilled were logged</i>

<i>Sub-sampling techniques and sample preparation</i>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i> <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	<i>The 1m RC samples were gathered by using a levelled cone splitter of the side of the rig.</i> <i>The samples the subject of this release were submitted to Bureau Veritas who dried the sample for 12 hrs and pulverised the entire sample until 95% passing 105µm. This method is considered appropriate to ensure sample representivity</i> <i>The samples were dominantly dry.</i> <i>Black Canyon inserted Certified Reference Material (CRM) at a rate of 1/50, blanks at a rate of 1/50 and field duplicates from the cone splitter at a rate of 1/50 for a total insertion rate of QA/QC materials at 6%</i> <i>The sub sampling technique and quality control procedures is considered appropriate to ensure sample representivity</i> <i>The sample size is considered appropriate for the grainsize and style of mineralisation</i>
<i>Quality of assay data and laboratory tests</i>	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i>	<i>The samples were submitted to the primary laboratory - Bureau Veritas in Canningvale, WA.</i> <i>The 2 – 3kg samples were weighed and dried prior to pulverising 100% of the sample 95% passing 105µm.</i> <i>The sample was then analysed using method XF203 for manganese ores using fusion disc XRF for Fe, SiO₂, Mn, Al₂O₃, TiO₂, P₂O₅, S, MgO, K₂O, CaO and BaO.</i> <i>Loss on Ignition (LOI) was also measured by Thermo Gravimetric Analysis (TGA)</i> <i>Review of the quality control results received to date that include CRM, blanks, duplicates show an acceptable level of accuracy (lack of bias) and precision has been achieved.</i> <i>In addition, Bureau Veritas has undertaken its own internal QAQC checks using CRM, Blanks and pulp duplicates and no issues have been reported or identified.</i> <i>A selected number of samples will also be submitted to a secondary laboratory for verification</i> <i>The CP is satisfied that the analysis was completed to an acceptable standard in the context in which the results have been reported.</i>

Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data.	Validation of the drilling files (collar, assay and lithology) was undertaken with field and data entry cross checks Adjustment of elemental oxides to primary element was completed using well known conversion factors. There were no twin holes at this stage There has been no adjustment to the assay data
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control.	All drill holes in the project area were surveyed by handheld GPS with an accuracy of +/-5 m. The accuracy of the location of the drill collars is sufficient at this stage of exploration and resource development. The grid system used: GDA94 / UTM zone 51S.
Data spacing and distribution	Data spacing for reporting of Exploration Results. Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied.	The 2025 drilling completed at Wandanya was conducted via a conventional drill grid. The nominal drill spacing was 40 m along east-west traverses and each traverse was spaced between 100 and 350m apart north-south. The drill spacing is sufficient to establish grade and geological continuity. No sample compositing has been applied.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	At Wandanya the drill lines were oriented east-west across the strike of the primary mineralisation trend. The drill holes were completed at 90 degrees (vertical). At Wandanya the mineralisation is relatively flat lying exhibiting a gentle dip to the east. The drill grid is assumed to be located both perpendicular to the planar orientation of the key mineralised horizon with no or limited bias introduced with respect to the strike or dip of the mineralised horizon.

Sample security	The measures taken to ensure sample security.	The samples were collected into bulka bags, sealed with cable ties and stored on site until the drill program was completed. The samples were then trucked to Perth in one consignment and delivered directly to Bureau Veritas in Canningvale. The bulka bags were inspected and audited by Bureau Veritas who did not report any suspicious or tampered samples.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No audits or reviews have taken place on the sampling techniques or data The CP was on site for the entire RC drill program and considers the sampling and sub sampling techniques to be equal to industry standard and appropriate for the style of mineralisation and the results being reported

Section 2 – Reporting of Exploration Results

Criteria	Explanation	Comment
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The Wandanya mineralisation is located within E46/1407 held 100% by Black Canyon Ltd. Tenement E47/1407 was granted on the 11/04/2022 and expires on 10/04/2027 The tenement upon which Wandanya is located are subject to a native title agreement with the Karlka Nyiyaparli Aboriginal Corporation. Archaeologic and Ethnographic heritage surveys have been completed on the Wandanya deposits which has enabled the drilling to be completed. Further Heritage surveys will be required to continue ground disturbing activities beyond the current drill areas. There are no other known impediments to obtaining a licence to operate in the area.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	No other material historic exploration has been completed on the tenement for manganese on E46/1407. For Wandanya Black Canyon completed a ground reconnaissance exercise in 2023 to map the manganese enrichments and determine down dip upside. The exercise proved significant manganese enrichment throughout the project areas both as outcropping, sub-cropping and as substantial float material. The early reconnaissance groundwork by Black Canyon was used as a basis for the 2023 DDIP survey and the September 2024 RC drilling programme.
Geology	Deposit type, geological setting and style of mineralisation.	The mineralisation model at Wandanya is preliminary but it appears to be a fault related hydrothermal stratabound deposit. There is likely supergene overprint to the original hydrothermal mineralisation. The mineralisation is located within a sedimentary sequence. From the base to the top of the sequence the geology comprises footwall dolomite, spotted manganese dolomite, massive manganese and manganese dolomite

Criteria	Explanation	Comment
		<i>breccia overlain by hangingwall dolomite. The consistency of the mineralisation down dip and along strike has been interpreted to represent fault related, hydrothermal stratabound style of manganese mineralisation. Geothite alteration is common above the manganese zone and hematite was logged within the mineralised zones as jaspilitic bands. Manganese intensity increases towards the base of the sequence.</i> <i>The overall geological sequence is dipping very shallowly to the east but is also openly folded with a northerly axial plane forming undulating outcrops. Several large north-easterly faults can be identified along strike associated with surface mineralisation.</i> <i>The hematite iron mineralisation appears to be a thicker up dip lateral equivalent of the manganese, but further drilling and evaluation is required to understand its genesis.</i> <i>The lithological sequence of the Wandanya project principally consists of the overlying Enachedong Formation carbonates overlying the Stag Arrow Formation sediments from the Proterozoic Manganese Group of the southern Oakover Basin. The mineralisation style at Wandanya is stratabound and maybe associated with hydrothermal fluids replacing a suitable reactive host rock at the base of the Enachedong Formation. Faults and structure are considered important features of this style of mineralisation with multiple northeast trending faults visible from surface imagery.</i>
Drill hole Information	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should</i>	<i>See drill hole location tables, plans and figures in main body of the release and Appendix 2.</i> <i>A listing of drill holes and their corresponding coordinates, elevation and depth are listed in Appendix 2.</i> <i>All drill holes reported that have been finalised and QA/QC checked and approved have been reported in Appendix 2.</i>

Criteria	Explanation	Comment
	<i>clearly explain why this is the case.</i>	
<i>Data aggregation methods</i>	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	<i>No grade cutting to assays has been undertaken.</i> <i>Aggregation of samples has been undertaken using simple average calculations for each 1m sample.</i> <i>Manganese intervals have been reported at 10% Mn cut off allowing 1m internal dilution that enables the total reported grade to be greater than 25% Mn.</i> <i>Assays have been reported as elements</i>
<i>Relationship between mineralisation widths and intercept lengths</i>	<i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i>	<i>The Wandanya Prospect is mostly flat lying exhibiting a gentle dip of mineralisation to the east and 90-degree (vertical) drill holes considered appropriate.</i> <i>The drill results reported are interpreted to represent close to true widths of the mineralisation and are reported as down hole length.</i>

Criteria	Explanation	Comment
<i>Diagrams</i>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	<i>Refer images within the body of this release for further details.</i>
<i>Balanced reporting</i>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	<i>Information considered material to the reader's understanding of the Exploration Results has been reported in the body of the text and significant results have selectively been reported to provide the reader with the potential tenor and widths of the mineralisation</i> <i>APPENDIX 2- contains the location, drill holes details and assay results as received and QA/QC approved for the June 2025 drill program.</i> <i>Holes denoted with NSR indicated that no mineralisation over 10% Mn was detected in that hole.</i>
<i>Other substantive exploration data</i>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	<i>No other substantive exploration has been completed at Wandanya.</i>
<i>Further work</i>	<i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	<i>Further RC and Diamond core drilling is required.</i> <i>Gravity surveys might also detect deeper buried mineralisation associated with the underlying sedimentary sequences.</i>

APPENDIX 2: SUMMARY DRILL HOLE COLLAR AND ASSAYS SUMMARIES

HOLE ID	PROSPECT	E_GDA94	N_GDA94	RL	EOH	DIP	AZIMUTH	FROM (m)	TO (m)	THICKNESS (m)	Mn (%)	Fe (%)	Drill intersection
