

## ASX Release

11 April 2025

# Broad, Au-Ag Mineralisation at Tigertown

### Highlights –

- Sunshine's strategy is to identify shallow (<50m) oxide gold resources for potential processing at nearby toll treating mills. Tigertown, Coronation, Liontown, and Plateau prospects at the Ravenswood Consolidated Project are being tested to rapidly evaluate their commercial potential.
- Assays have been received for first-pass reverse circulation (RC) drilling (7 holes, 641m) at Tigertown. Multiple mineralised horizons were encountered with 17 individual significant intersections >0.50g/t Au returned.
- Drilling intersected broad zones of mineralisation including:
  - **30m @ 0.58g/t Au, 57g/t Ag** from 34m (25TTTRC004)  
Including **4m @ 2.01g/t Au, 201g/t Ag, 4.14% Zn, 1.93% Pb** from 38m (25TTTRC004)
  - **8m @ 0.87g/t Au, 63g/t Ag** from 72m (25TTTRC002)
- Most mineralisation was intersected at depths of >30m from surface. The next phase of drilling at Tigertown will target these near surface extensions to defined Au-Ag mineralisation. Planning is also ongoing for Plateau drilling.
- Liontown shallow RC drilling will commence in April 2025 and will target samples for metallurgical test work and an upgrade of the current Inferred Resource (21Koz Au @ 1.8g/t Au and 26g/t Ag for 307Koz Ag) to Indicated.

**Sunshine Metals Limited (ASX:SHN, "Sunshine") has intercepted broad zones of Au-Ag mineralisation at Tigertown, part of the Ravenswood Consolidated Project.**

**Sunshine Managing Director, Dr Damien Keys**, commented *"The gold-silver intersections demonstrate the potential for a larger oxide system at Tigertown. Our best result is our shallowest significant intersection. The drilling has now refined our geological model and will allow us to target the near surface gold-silver more effectively."*

*Tigertown is just one of the shallow targets that we will be testing in early 2025. Drilling will test other targets Liontown (oxide extensions), Liontown West, Coronation and Plateau as we rapidly pursue our shallow oxide strategy."*

### Tigertown prospect

Sunshine completed a 7-hole (641m) RC drill program at Tigertown. The program was designed to assess oxide Au and appears to have intersected mineralisation below the oxidised profile. The drilling intercepted broad zones of quartz-barite veining, silicified sediments and sulphides including

sphalerite, pyrite and galena. Despite the deeper intersections, the drilling has returned broad zones of Au and Ag mineralisation with best results including:

- **30m @ 0.58g/t Au, 57g/t Ag** from 34m (25TTRC004)  
Including **4m @ 2.01g/t Au, 201g/t Ag, 4.14% Zn, 1.93% Pb** from 38m (25TTRC004)
- **8m @ 0.87g/t Au, 63g/t Ag, 1.08% Zn** from 72m (25TTRC002)
- **15m @ 0.69g/t Au, 27g/t Ag** from 50m (25TTRC003)  
Including **4m @ 1.29g/t Au, 17g/t Ag** from 61m (25TTRC003)
- **4m @ 1.15g/t, 10g/t Ag** from 70m (25TTRC005)

Thickness and Au endowment are interpreted to be stronger at shallow depths and within the oxidised profile. The probable supergene enrichment is evident in hole 25TTRC004 and historic drilling where shallow intersections assayed:

- **2m @ 3.75g/t Au, 58g/t Ag** from 14m (LLRC003)  
And **17m @ 3.05g/t Au, 40g/t Ag** from 22m (LLRC003)
- **33m @ 1.95g/t Au, 30g/t Ag** from 12m (MWR037)  
And **1m @ 1.77g/t Au, 35g/t Ag** from 49m to EOH (MWR037)

**Figure 1:** Shallow oxide gold targets at the Ravenswood Consolidated Project and proximity to established mines, infrastructure and the mining hub of Charters Towers in Queensland. Two potential toll treating mills are nearby at Black Jack and Pajingo. Coronation is located ~28km south of Charters Towers.

Mineralisation models have been refined, and next Tigertown drilling will target shallow (<30m vertical depth) extensions to the mineralisation. This drilling will also assess up-dip extensions of strong Ag intersections ~680m south-east, and along strike of Tigertown. Historic assay results include:

- **3m @ 301g/t Ag** from 18m (LLRC032)
- **& 3m @ 796g/t Ag**, from 33m (LLRC032)
- **2m @ 440g/t Ag**, from 96m to EOH (LLRC040)
- **3m @ 189g/t Ag**, from 87m (LLRC048)

**Figure 2:** Tigertown plan view with lode projections and the new drill intersections (yellow labels).

**Figure 3:** Cross section through 401000mE showing projected Tigertown mineralisation, historic holes, 25TTRC004 drill results.

**Figure 4:** Plan view of the Liontown Dome, showing contoured soil anomalism (Cu+Zn+Pb in soils) with key prospects and historic drilling results annotated. Areas of outcrop or subcrop (effective soil sampling) are highlighted within the black outlined shapes.

### Liontown RC Drilling - upcoming

Consistent with Sunshine's strategy of rapidly identifying shallow (<50m), oxide Au resources for potential processing at nearby toll treating mills, Liontown drilling will commence in April 2025. The program will be used to source samples for metallurgical test work and will infill the current Resource to enable an upgrade from an Inferred to Indicated Resource.

The current Inferred oxide Resource for stands at 360Kt @ 1.8g/t Au and 26g/t Ag for 21Koz Au and 307Koz Ag contained.

**Figure 5:** Liontown oxide/transitional Resource model beneath granted mining lease ML102007 (red) with known historical workings displayed.

### Gold oxide focus

Sunshine's strategy is to identify shallow (<50m), oxide gold resources for processing at potential, nearby toll treating mills. Sunshine is targeting the following: Tigertown, Coronation, Liontown, and Plateau. Sunshine aims to rapidly evaluate the commercial potential of these assets.

Liontown is the most advanced of the shallow Au targets with an Inferred Resource in oxide and transitional zones. The Resource is located on a mining lease. and will be upgraded to Indicated with infill drilling and metallurgical test work.

Plateau represents an advanced target with an Inferred Resource totalling 49koz Au at 2.0 g/t Au<sup>1</sup>. To advance the Resource classification, ~1,000m of drilling and metallurgical testing are required.

<sup>1</sup> Refer to SHN ASX release, 20 January 2023 "Consolidation of High-Grade Advanced Au Prospects, RW"

These activities are expected to commence in May 2025. Sunshine is earning into the Plateau Resource through a Farm-In agreement with Rockfire Resources<sup>2</sup>.

Both Tigertown and Coronation are advanced exploration targets, with the initial drilling programs designed to quickly assess shallow Au potential. Positive exploration results will be followed by additional drilling and preliminary metallurgical studies.

**Figure 6:** Ravenswood Consolidated Project in proximity to local infrastructure and Sunshine's head office in Townsville.

### Planned activities

The Company has a busy period ahead including the following key activities and milestones:

- 15-16 April 2025: Gold Coast Gold Conference
- April 2025: Coronation drilling results
- April 2025: RC Drilling commencing Lione town oxide
- May 2025: Drilling results from Lione town oxide
- May 2025: RC Drilling commencing Plateau oxide
- June 2025: Lione town Metallurgy and Resource upgrade
- June 2025: Mining study commences at Lione town

Follow up drilling at Tigertown, Coronation, Lione town, and Plateau

<sup>2</sup> Refer to SHN ASX release, 20 January 2023 "Consolidation of High-Grade Advanced Au Prospects, RW"

**Sunshine's Board has authorised the release of this announcement to the market.**

## **Competent Person's Statement**

*The information in this report that relates to Exploration Results is based on, and fairly represents, information compiled by Mr Matt Price, a Competent Person who is a Member of the Australian Institute of Geoscientists (AIG) and the Australian Institute of Mining and Metallurgy (AusIMM). Mr Price has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Mr Price consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

*The information in this report that relates to Mineral Resources at Lioneville is based on information compiled and reviewed by Mr Chris Grove who is a Member of the Australian Institute of Mining and Metallurgy (AusIMM) and is a Principal Geologist employed by Measured Group Pty Ltd. Mr Grove has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Mineral Resources. Mr Grove consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

*The information in this report that relates to Mineral Resources is based on information compiled and reviewed by Dr Damien Keys, who is a Member of the Australasian Institute of Mining and Metallurgy and a Member of the Australian Institute of Geoscientists (AIG). Dr Keys has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Mineral Resources. Dr Keys consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

*The information in this report that relates to Mineral Resources at Waterloo and Orient is based on information compiled and reviewed by Mr Stuart Hutchin, who is a Member of the Australian Institute of Geoscientists (AIG) and is a Principal Geologist employed by Mining One Pty Ltd. Mr Stuart Hutchin has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Mineral Resources. Mr Stuart Hutchin consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

*The information in this report that relates to Mineral Resources at Lioneville East is based on information compiled and reviewed by Mr Peter Carolan, who is a Member of the Australasian Institute of Mining and Metallurgy and was a Principal Geologist employed by Red River Resources Ltd. Mr Peter Carolan has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Mineral Resources. Mr Peter Carolan consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.*

## About Sunshine Metals

### Big System Potential.

**Ravenswood Consolidated Project (Zn-Cu-Pb-Au-Ag-Mo):** Located in the Charters Towers-Ravenswood district which has produced over 20Moz Au and 14mt of VMS Zn-Cu-Pb-Au ore. The project comprises:

- The newly interpreted Lione Dome, hosting multiple gold and base metal prospects;
- a Zn-Cu-Pb-Au VMS Resource of 7.0mt @ 4.0g/t Au (904koz AuEq) or 11.1% ZnEq (42% Indicated, 58% Inferred<sup>3</sup>);
- the under-drilled Lione Au-rich footwall with significant intersections including:
  - **20.0m @ 18.2g/t Au** (109m, 24LTRC005)
  - **17.0m @ 22.1g/t Au** (67m, 23LTRC002)
  - **8.0m @ 11.7g/t Au & 0.9% Cu** (115m, LLRC184)
  - **8.1m @ 10.7g/t Au** (154m, LTDD22055)
  - **16.2m @ 4.54g/t Au, 1.11% Cu** (from 319m, 24LTDD024)
  - **5.0m @ 27.9g/t Au, 1.7% Cu** (20m, LRC018)
  - **2.0m @ 68.6g/t Au** (24m, LRC0043)
- advanced Au-Cu VMS targets at Coronation and Highway East, analogous to the nearby Highway-Reward Mine (3.9mt @ 5.3% Cu & 1.1g/t Au mined);
- overlooked orogenic, epithermal and intrusion related Au potential with numerous historic gold workings and drill ready targets; and

**\*Investigator Project (Cu):** Located 100km north of the Mt Isa, home to rich copper-lead-zinc mines that have been worked for almost a century. Investigator is hosted in the same stratigraphy and similar fault architecture as the Capricorn Copper Mine, located 12km north.

**\*Hodgkinson Project (Au-W):** Located between the Palmer River alluvial gold field (1.35 Moz Au) and the historic Hodgkinson gold field (0.3 Moz Au) and incorporates the Elephant Creek Gold, Peninsula Gold-Copper and Campbell Creek Gold prospects.

*\*A number of parties have expressed interest in our other quality projects (Investigator Cu and Hodgkinson Au-W). These projects will be divested in an orderly manner in due course.*

---

<sup>3</sup> This announcement contains references to exploration results and estimates of mineral resources that were first reported in Sunshine's ASX announcement dated 11 December 2024. Sunshine confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcement. In relation to estimates of mineral resources, Sunshine confirms that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. Metal equivalent calculation on next page.

### Recoverable Gold & Zinc Equivalent calculations

The gold and zinc equivalent grades for Greater Liontown (g/t AuEq, % ZnEq) are based on the following prices:

US\$2,900/t Zn, US\$9,500/t Cu, US\$2,000/t Pb, US\$2,500/oz Au, US\$30/oz Ag.

Metallurgical metal recoveries are broken into two domains: copper-gold dominant and zinc dominant. Each domain and associated recoveries are supported by metallurgical test work and are: Copper-gold dominant – 92.3% Cu, 86.0% Au, Zinc dominant 88.8% Zn, 80% Cu, 70% Pb, 65% Au, 65% Ag.

The AuEq calculation is as follows:  $AuEq = (Zn\ grade\% * Zn\ recovery * (Zn\ price\ \$ / t * 0.01 / (Au\ price\ \$ / oz / 31.103))) + (Cu\ grade\ \% * Cu\ recovery\ \% * (Cu\ price\ \$ / t / (Au\ price\ \$ / oz / 31.103))) + (Pb\ grade\ \% * Pb\ recovery\ \% * (Pb\ price\ \$ / t / (Au\ price\ \$ / oz / 31.103))) + (Au\ grade\ g / t / 31.103 * Au\ recovery\ \% ) + (Ag\ grade\ g / t / 31.103 * Ag\ recovery\ \% * ((Ag\ price\ \$ / oz / 31.103 / (Au\ price\ \$ / oz / 31.103)))$

The ZnEq calculation is as follows:  $ZnEq = (Zn\ grade\% * Zn\ recovery) + (Cu\ grade\ \% * Cu\ recovery\ \% * (Cu\ price\ \$ / t / Zn\ price\ \$ / t * 0.01))) + (Pb\ grade\ \% * Pb\ recovery\ \% * (Pb\ price\ \$ / t / Zn\ price\ \$ / t * 0.01)) + (Au\ grade\ g / t / 31.103 * Au\ recovery\ \% * ((Au\ price\ \$ / oz / 31.103 / Zn\ price\ \$ / t * 0.01))) + (Ag\ grade\ g / t / 31.103 * Ag\ recovery\ \% * ((Ag\ price\ \$ / oz / 31.103 / Zn\ price\ \$ / t * 0.01)))$

For Waterloo transition material, recoveries of 76% Zn, 58% Cu and 0% Pb have been substituted into the ZnEq formula. For Liontown oxide material, recoveries of 44% Zn, 40% Cu and 35% Pb have been substituted into the ZnEq formula. Further metallurgical test work is required on the Liontown oxide domain. It is the opinion of Sunshine and the Competent Person that the metals included in the ZnEq formula have reasonable potential to be recovered and sold.

The Ravenswood Consolidated VMS Resource is comprised of 7.0mt @ 1.3g/t Au, 0.9% Cu, 5.5% Zn, 1.7% Pb and 31g/t Ag (11.1% ZnEq). For further details refer to SHN ASX Release, 11 December 2024, "904koz AuEq Resource at Ravenswood Consolidated".

## APPENDIX A –DRILL COLLAR AND SURVEY INFORMATION FOR SHN DRILLING

\*Note – Coordinates are reported in GDA94, Zone 55.

# SHN earning 75% equity in Lighthouse Farm-In tenements. **Refer to SHN ASX release, 20 January 2023 “Consolidation of High-Grade Advanced Au Prospects, RW”**

The gold and zinc equivalent grades for Greater Liontown (g/t AuEq, % ZnEq) are based on the following prices:

US\$2,900t Zn, US\$9,500t Cu, US\$2,000t Pb, US\$2,500oz Au, US\$30oz Ag. Metallurgical metal recoveries are broken into two domains: copper-gold dominant and zinc dominant. Each domain and associated recoveries are supported by metallurgical test work and are: Copper-gold dominant – 92.3% Cu, 86.0% Au, Zinc dominant 88.8% Zn, 80% Cu, 70% Pb, 65% Au, 65% Ag.

The AuEq calculation is as follows:  $AuEq = (Zn\ grade\% * Zn\ recovery * (Zn\ price\ \$ / t * 0.01 / (Au\ price\ \$ / oz / 31.103))) + (Cu\ grade\% * Cu\ recovery * (Cu\ price\ \$ / t / (Au\ price\ \$ / oz / 31.103))) + (Pb\ grade\% * Pb\ recovery * (Pb\ price\ \$ / t / (Au\ price\ \$ / oz / 31.103))) + (Au\ grade\ g / t / 31.103 * Au\ recovery\%) + (Ag\ grade\ g / t / 31.103 * Ag\ recovery\% * ((Ag\ price\ \$ / oz / 31.103 / (Au\ price\ \$ / oz / 31.103)))$

The ZnEq calculation is as follows:  $ZnEq = (Zn\ grade\% * Zn\ recovery) + (Cu\ grade\% * Cu\ recovery * (Cu\ price\ \$ / t / Zn\ price\ \$ / t * 0.01))) + (Pb\ grade\% * Pb\ recovery * (Pb\ price\ \$ / t / Zn\ price\ \$ / t * 0.01)) + (Au\ grade\ g / t / 31.103 * Au\ recovery\% * ((Au\ price\ \$ / oz / 31.103) / Zn\ price\ \$ / t * 0.01))) + (Ag\ grade\ g / t / 31.103 * Ag\ recovery\% * ((Ag\ price\ \$ / oz / 31.103) / Zn\ price\ \$ / t * 0.01))$

For Waterloo transition material, recoveries of 76% Zn, 58% Cu and 0% Pb have been substituted into the ZnEq formula. For Liontown oxide material, recoveries of 44% Zn, 40% Cu and 35% Pb have been substituted into the ZnEq formula. Further metallurgical test work is required on the Liontown oxide domain. It is the opinion of Sunshine and the Competent Person that the metals included in the ZnEq formula have reasonable potential to be recovered and sold.

The Ravenswood Consolidated VMS Resource is comprised of 7.0mt @ 1.3g/t Au, 0.9% Cu, 5.5% Zn, 1.7% Pb and 31g/t Ag (11.1% ZnEq). **For further details refer to SHN ASX Release, 11 December 2024, “904koz AuEq Resource at Ravenswood Consolidated”.**

**Table 1, Section 1 - Sampling Techniques and Data**

| Criteria            | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Sampling techniques | <p><i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i></p> <p><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></p> <p><i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i></p> | <p><b>DRILLING</b></p> <p><b>SHN</b> – RC drill holes were sampled as individual, 1 m length samples from the rig split. Individual metre samples were collected as a 12.5% split collected from the drill rig. Individual RC samples were collected in calico sample bags and grouped into polyweave bags for dispatch (approximately five per bag).</p> <p>SHN samples are analysed at Australian Laboratory Services (ALS) in Townsville (Prep &amp; Au) and Brisbane (ME) where samples are crushed to sub 6mm, split and pulverised to sub 75µm. A sub sample is collected for a four-acid digest and ICP-OES / MS analysis of 34 – 48 elements, including Ag, Cu, Pb and Zn. Samples are assayed for Au using a 30g Fire Assay technique. Assays over 100g Au using this technique are re-assayed using gravimetric analysis. Ba over 1% is re-analysed using XRF.</p> <p><b>Historic</b> – RC / Percussion samples were typically collected in 1m intervals with all samples sent for assay. Diamond core was reviewed with specific zones selected for assay by the Geologist. These zones were then sawn longitudinally in half, with the half core sample sent for analysis. Core sizes ranged from NQ to HQ. No specific batch information has been located, however industry standard preparation and analysis methods were believed to be used. The majority of the samples were analysed following a three- or four- acid digest and either via Atomic Absorption Spectrum (AAS) or Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) for the analysis of base metals. Gold was analysed via fire assay using either 25 g, 30 g or 50 g charge with an AAS finish was employed.</p> |
| Drilling techniques | <p><i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p><b>DRILLING</b></p> <p><b>SHN</b> – Reverse circulation drilling utilising an 8inch open-hole hammer for first 10m (pre-collar) and a 5.5inch RC hammer for the remainder of the drill hole.</p> <p><b>Historic</b> – Percussion drill holes utilised a 4 ¼ to 5 ½ inch hammer bit. Conventional and wireline diamond drilling techniques were used through the various programs. Core extraction utilised a conventional coring system. Historical core was not oriented.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Quality of assay data and Laboratory tests | <p><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></p> <p><i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p> <p><i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i></p> | <p><b>DRILLING</b></p> <p><b>SHN</b> – Samples are assayed using a 30g fire assay for gold with AAS finish, which is considered appropriate for this style of mineralisation. Fire assay is considered total assay for gold. Assays reporting over 100g/t Au were re-assayed using gravimetric methods to report a final assay. The QAQC procedures involved Blanks, Field Duplicates and CRMs inserted at a rate of 1 in 10 and it is considered that acceptable levels of accuracy and precision were established for the purposes of mineral resource estimation. All other elements are assayed using an ICP-MS/OES, with overrange Ba reported by XRF. No QAQC issues were identified during the reporting of the SHN assays however a review is ongoing.</p> <p><b>Historic</b> – Historical assays have not been validated through re-assay. Assay methods are considered appropriate for exploration drilling. No Quality Assurance and Quality Control is available for historical drillholes within this report. Since 2007 it is considered that acceptable levels of accuracy and precision have been established. Given that reputable licensed laboratories were utilised it is considered that acceptable levels of accuracy and precision were established.</p> |
| Verification of sampling and assaying      | <p><i>The verification of significant intersections by either independent or alternative company personnel.</i></p> <p><i>The use of twinned holes.</i></p> <p><i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i></p> <p><i>Discuss any adjustment to assay data</i></p>                                                                                                                                                                                                                                                                                       | <p><b>DRILLING</b></p> <p><b>SHN</b> – No new drill holes reported within this document have been twinned or were designed as twinned holes. Verification of significant intercepts has been undertaken internally by alternative company personnel.</p> <p><b>Historic</b> – Documentation and information regarding data entry procedures, data verification, and data storage (physical and electronic) protocols is unknown.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Location of data points                    | <p><i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i></p> <p><i>Specification of the grid system used.</i></p> <p><i>Quality and adequacy of topographic control.</i></p>                                                                                                                                                                                                                                                                                                                                     | <p><b>DRILLING</b></p> <p><b>SHN</b> – Drilled holes have been surveyed using PPKGPS with &lt;30mm horizontal and vertical accuracy. Coordinates are displayed within GDA94, Zone 55 format. Downhole surveys were conducted with an industry-standard gyroscopic survey tool.</p> <p><b>Historic</b> – Historic drill collar locations were determined by a variety of methods in different programmes and included DGPS pickup of 105 historical collars in the area by Liontown Resources in 2007. Historic down hole surveys were taken using Eastman single shot cameras.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Criteria                                                | Explanation                                                                                                                                                                                                                                                                                                                                                                                       | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Data spacing and distribution                           | <p><i>Data spacing for reporting of Exploration Results.</i></p> <p><i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></p> <p><i>Whether sample compositing has been applied.</i></p>                            | <p><b>DRILLING</b></p> <p><b>SHN</b> – Holes were typically spaced between 25 – 45m.</p> <p><b>Historic</b> – LLRC drill holes are typically spaced 40 – 50m apart at the Tigertown prospect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Orientation of data in relation to geological structure | <p><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></p> <p><i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></p> | <p><b>DRILLING</b></p> <p><b>SHN &amp; Historic</b> – Drill holes were oriented perpendicular to the perceived strike of the host lithologies or lodes. Drill holes were drilled at a dip based on the logistics and dip of target to be tested. Orientation of drilling was designed to not bias sampling.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Sample security                                         | <p><i>The measures taken to ensure sample security.</i></p>                                                                                                                                                                                                                                                                                                                                       | <p><b>DRILLING</b></p> <p><b>SHN</b> – RC drill samples were collected by the Drill Contractor and then collected on site by the SHN Field Technician. The sample was then validated against a pre-prepared sample sheet to ensure the sample matched the correct interval. Samples were then collected into groups of five and placed in a labelled polyweave bag. The samples were then dispatched from site directly to the lab by SHN field personnel. Diamond core samples are collected at the time of cutting by the SHN Field Technician and validated against a pre-prepared sample sheet. In both cases, samples were then collected into groups of five and placed in a labelled polyweave bag. The samples were then dispatched from site directly to the lab by SHN field personnel.</p> <p><b>Historic</b> – Sample security for historic programmes cannot be validated.</p> |
| Audits or reviews                                       | <p><i>The results of any audits or reviews of sampling techniques and data.</i></p>                                                                                                                                                                                                                                                                                                               | <p>No audits have been carried out on the reported drill or geochemistry results herein. Internal validation of results has taken place.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Section 2 - Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

| Criteria                                | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                       | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Mineral tenement and land tenure status | <p><i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></p> <p><i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></p> | <p>Ravenswood Consolidated Exploration Permits are: EPMs 10582, 12766, 14161, 16929, 18470, 18471, 18713, 25815, 25895, 26041, 26152, 26303, 26304, 26718, 27537, 27520, 27824, 27825, 28237, 28240, Mining Lease 10277 and Mining Lease Applications 100221, 100290 and 100302 for a total of 1326km<sup>2</sup>. The tenements are in good standing and no known impediments exist. These leases are held in their entirety by Sunshine (Ravenswood) Pty Ltd and Sunshine (Triumph) Pty Ltd, 100% owned subsidiaries of Sunshine Metals Ltd.</p> <p>The Lione town Resource is located in its entirety on ML 10277 and EPM 14161 and under Mining Lease Applications MLA 100290 and MLA 100302.</p> <p>The Thalanga mill and mining operation was abandoned by administrators to Red River Resources. A restricted area has been placed over the mill, dumps and tailings facilities. The Queensland Department of Environment is now responsible for the rehabilitation of the aforementioned facilities. There are no known other Restricted Areas located within the tenure.</p> <p>The tenure reported within exists on the recognised native land of the Jangga People #2 claim.</p> <p>A 0.8% Net Smelter Return (NSR) royalty is payable to Osisko Ventures Ltd and a 0.7% NSR royalty payable to the Guangdong Guangxin Mine Resources Group Co Ltd (GMRG) on sale proceeds of product extracted from EPM 14161.</p> <p>Five third-party Mining Leases are present exist on these Exploration Permits – named MLs 1571, 1734, 1739 and 10028 (Thalanga Copper Mines Pty Ltd) and 100021 (Clyde Ian Doxford).</p> <p>The Lighthouse Project consists of EPMs 25617 and 26705. All EPMs are owned 100% by BGM Investments Pty Ltd, a wholly owned subsidiary of Rockfire Resources Limited. No current Mining Leases exist on the tenure. South-eastern blocks on EPM 26705 are situated within the Burdekin Falls Dam catchment area. Sunshine Metals has the option to earn 75% of the project.</p> |
| Exploration done by other parties       | <i>Acknowledgment and appraisal of exploration by other parties.</i>                                                                                                                                                                                                                                                                                                                                                                              | <p>Exploration activities have been carried out by Nickel Mines (1970-1973), Esso (1982-1983), Great Mines (1987), Pancontinental (1994-1995), and Lione town Resources (2007). Work programs included surface mapping, and sampling, costeans, drilling and geophysics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Geology                                 | <i>Deposit type, geological setting and style of mineralisation.</i>                                                                                                                                                                                                                                                                                                                                                                              | <p>Drilling activities will assist in determining geological setting and style of mineralisation. However, current interpretation is as follows:</p> <p><b>TIGERTOWN</b></p> <p>Tigertown is interpreted as a Au-Ag bearing, Volcanogenic Massive Sulphide related system located within the Trooper Creek Formation. It is hosted in a sequence of volcanics and sediments with mineralisation hosted in stratiform, baritic lodes which trend northwest-southeast.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Relationship between mineralisation widths and intercept length | <p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i></p> | All widths reported herein are downhole width only, with no true widths reported. However, all drill holes are interpreted to have intercepted the lodes at an optimal angle. More data will be required to accurately assess the true orientation of the mineralisation.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Diagrams                                                        | <p><i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i></p>                                                                                                                            | All relevant diagrams are located within the body of this report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Balanced reporting                                              | <p><i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i></p>                                                                                                                                                                     | All drill intercepts are recorded within the body of this report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Other substantive exploration data                              | <p><i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test</i></p>                                                                                                                                       | <p>All meaningful and material data is reported within the body of the report.</p> <p>Relevant reports for this release are:</p> <ul style="list-style-type: none"> <li>ASX: SHN, 24<sup>th</sup> February 2025, Gold to surface, drilling to commence at Tigertown</li> <li>ASX: SHN, 28<sup>th</sup> January 2025, New interpretation near Lione town firms up targets</li> <li>ASX: SHN, 8<sup>th</sup> May 2023, Fully Funded Acquisition of Greater Lione town</li> </ul>                                                                                                                                                                                                                                                     |
