

ASX Announcement
11 December 2024

Amended Announcement – Highly Successful Reserve Upgrade Drilling Program Completed at Antler

As requested by the ASX, New World Resources Limited (ASX:NWC) (“the Company”) attaches an amended version of its announcement of 6 December 2024, titled “Highly Successful Reserve Upgrade Drilling Program Completed at Antler”, which now includes a drill hole plan showing the location of the Company’s recent drilling (refer Figure 2 in the announcement).

For further information please contact:

This announcement has been authorised for release by Ian Cunningham, Company Secretary

HIGHLY SUCCESSFUL RESERVE UPGRADE DRILLING PROGRAM COMPLETED AT ANTLER

Most recent intercept of 18.6m @ 5.9% Cu-equivalent returned from Ore Reserve definition drilling, enhancing the robustness of the geological model ahead of pending Resource update

Highlights

- Exceptionally thick, high-grade assay results returned for the final Reserve definition hole at the Antler Copper Deposit in Arizona, USA.
- Hole 139, drilled into the Main Shoot, has returned assay results including:
 - **18.6m @ 2.8% Cu, 9.4% Zn, 0.9% Pb, 41.0 g/t Ag and 0.29 g/t Au (18.6m @ 5.9% Cu-Equivalent)**
- As has consistently been the case throughout the in-fill drilling program, this result exceeded expectations from the Resource model.
- This drilling program has been extremely successful in increasing the confidence in the thickness and grade of the mineralisation to be mined in the first 3-5 years of operations and re-affirms the robustness of the geological model.
- As a result of this drilling program, a sizeable component of the Antler Mineral Resource is likely to be upgraded to the “Measured” category when the JORC Mineral Resource Estimate is updated in the first quarter of 2025.
- A composite sample of representative drill core is now being assembled for advanced metallurgical testwork, which will commence in the coming weeks.
- Exploration continues at the Antler Copper Project, aiming to expand the Resource base.

New World’s Managing Director, Nick Woolrych, commented:

“Antler continues to consistently deliver high-grade mineralisation with recent in-fill drilling yielding one of the thickest and highest-grade intercepts seen to-date, being 18.6m @ 5.9% Cu-Equivalent. This spectacular hole is the culmination of a drilling program aimed at increasing Resource classification confidence in the first 3-5 years of the Antler mine life.

“Overall, the Reserve definition drilling program exceeded our expectations, which allows New World to proceed confidently to DFS and into development. We have started work on an updated Resource, which is expected to be finalised in Q1 2025, with the outcomes expected to include a sizeable component upgraded to Measured.

“In parallel, New World has commenced other key DFS workstreams, including metallurgical testing and detailed mine and infrastructure design. The State and Federal permitting processes are also proceeding well, and the Company has received exceptional support from both the local and Federal governments, including recent site visits from Congressman Paul Gosar – the recently re-elected representative of Arizona’s 9th Congressional District and therefore, our representative in Washington. New World is firmly on track to rapidly advance one of the world’s highest-grade and most economically robust copper development projects into production in 2027!”

New World Resources (“NWC”, “New World” or the “Company”) is pleased to report the final assay results from its highly successful Reserve in-fill holes drilled recently at its Antler Copper Deposit in Arizona, USA.

A total of 10 Ore Reserve definition drill holes have recently been completed within the Antler Deposit (for 4,564m). These holes have been targeted to test the portions of the Antler Deposit that are likely to be mined in the first 3-5 years of operations (as determined in the Pre-Feasibility Study announced on 17 July 2024), to ensure confidence in the Reserve model.

The final hole from reserve definition drilling intersected exceptionally thick and high-grade mineralisation in the Main Shoot, with assay results including:

- 18.6m @ 2.8% Cu, 9.4% Zn, 0.9% Pb, 41.0 g/t Ag and 0.29 g/t Au from 390.0m
(18.6m @ 5.9% Cu-Equiv.); and
2.4m @ 0.69% Cu, 3.34% Zn, 0.89% Pb, 23.5g/t Ag, and 0.1 g/t Au from 428.9
(2.4m @ 1.9% Cu-Equiv.)

These results exceeded expectations from the current Resource model and, as a result, both the tonnes and the grade of the corresponding part of the Mineral Resource are expected to be enhanced as a result of this drilling.

Assay results from the nine previously announced Ore Reserve definition holes drilled recently across the very high-grade Antler Copper Deposit included:

- 10.2m @ 7.7% Cu, 9.4% Zn, 0.9% Pb, 49.7g/t Ag and 0.74 g/t Au
(10.2m @ 10.8% Cu-Equiv.) in ANT137
- 8.0m @ 5.9% Cu, 7.6% Zn, 0.6% Pb, 37.3g/t Ag and 0.46 g/t Au
(8.0m @ 8.3% Cu-Equiv.) in ANT134
- 5.3m @ 4.12% Cu, 8.64% Zn, 1.55% Pb, 51.3 g/t Ag and 0.72 g/t Au
(5.3m @ 6.8% Cu-Equiv.) in ANT130
- 2.5m @ 10.0% Cu, 4.2% Zn, 1.1% Pb, 55.5g/t Ag and 0.99 g/t Au
(2.5m @ 11.8% Cu-Equiv.) in ANT131; and
3.9m @ 0.7% Cu, 3.91% Zn, 0.2% Pb, 9.0g/t Ag, and 0.06g/t Au
(3.9m @ 1.9% Cu-Equiv.) from a newly identified zone of mineralization
- 2.5m @ 7.3% Cu, 6.5% Zn, 1.7% Pb, 76.5g/t Ag and 0.42 g/t Au
(2.5m @ 9.7% Cu-Equiv.) in ANT133
- 2.4m @ 4.5% Cu, 4.2% Zn, 0.33% Pb, 31.3 g/t Ag and 0.08 g/t Au
(2.4m @ 5.3% Cu-Equiv.) in ANT132

The Reserve definition drilling program has been extremely successful, regularly intersecting mineralisation of a higher grade and greater thickness than was modelled.

As a result of the Reserve definition drilling program, the robustness of the mineralisation at the Antler Copper Deposit and the PFS mine design has been reaffirmed, and a sizeable component of the Mineral Resource is likely to be upgraded to “Measured” status when the next JORC Mineral Resource Estimate is completed in 2025.

A composite sample of representative core from recent drilling is now being assembled for advanced metallurgical testwork, which is scheduled to commence in the coming weeks.

Exploration activities are continuing at the Antler Copper Project, aiming to continue to expand the resource base.

Figure 1. Long Section of grade x thickness for copper equivalent results from the Antler Deposit showing historical underground workings, grade-thickness results for all surface drilling and select significant intersections in previous drilling (yellow text boxes for previously announced results, orange text boxes for Reserve upgrade holes previously announced and green text boxes for new results announced here).

Antler Copper Project – Project Summary

The Antler Copper Project is located in a sparsely populated part of northern Arizona, approximately 200km south-east of Las Vegas and 350km north-west of Phoenix. New World currently bases its operations 40km to the north of the Project, in the city of Kingman, which has a population of approximately 35,000. The area is very well serviced with large scale infrastructure and there are multiple mining operations in the region.

A PFS, released on 17 July 2024, evaluated the development of an underground mining operation, together with construction of a processing plant, pastefill plant, a fully-lined dry-stack tailings storage facility and associated infrastructure.

The JORC Mineral Resource Estimate (MRE) for the Antler Deposit currently comprises: 11.4Mt @ 2.1% Cu, 5.0% Zn, 0.9% Pb, 32.9g/t Ag and 0.36g/t Au (11.4Mt @ 4.1% Cu-equivalent). This makes the Antler Deposit one of the highest-grade copper deposits in the world (on a copper-equivalent basis).

The Antler Deposit remains open at depth and along strike. The Company is committed to ongoing local and regional exploration and is currently continuing to drill to test numerous priority targets. Additional discovery could potentially extend the life of the mining operation at Antler and/or result in a larger production profile, both of which would likely further enhance the already very robust economics of developing the Antler Project.

Additional Information

Qualified and Competent Persons

The information in this announcement that relates to exploration results is based on, and fairly reflects, information compiled by Mr Patrick Siglin, who is the Company's Exploration Manager. Mr Siglin is a Registered Member of the Society for Mining, Metallurgy and Exploration. Mr Siglin has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and the activity he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results and Mineral Resources (JORC Code). Mr Siglin consents to the inclusion in the announcement of the matters based on the information in the form and context in which it appears.

Previously Reported Results

There is information in this announcement relating to:

- (i) the Ore Reserve Estimate for the Antler Copper Deposit, which was previously announced on 17 July 2024;
- (ii) the November 2022 Mineral Resource Estimate for the Antler Copper Deposit, which was previously announced on 28 November 2022; and
- (ii) exploration results which were previously announced on 14 January, 9 and 20 March, 17 and 24 April, 12 May, 3 June, 7, 21 and 28 July, 3 and 31 August, 22 September, 22 October and 2 and 10 and 25 November 2020 and 18 January and 2, 12 and 19 March and 8 and 20 April, 20 May, 21 June, 15 and 29 July, 16 August, 22 September, 13 October, 1, 5 and 30 November 2021 and 20 January, 1 March, 20 April and 14 and 22 July, 26 September, 4 and 11 October, 23 November and 5 December 2022, 7 and 13 June, 31 July, 18 September, 20 October, 13 November and 30 November 2023, 8 January, 5 February, 18 and 22 March, 30 May, 31 July, and 27 August, 2024.

Other than as disclosed in those announcements, the Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements, and that all material assumptions and technical parameters have not materially changed. The Company also confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

All references to the Pre-Feasibility Study and its outcomes in this announcement relate to the announcement of 17 July 2024 titled "Antler Copper Project Pre-Feasibility Study". Please refer to that announcement for full details and supporting information.

Forward Looking Statements

Information included in this announcement constitutes forward-looking statements. When used in this announcement, forward-looking statements can be identified by words such as "anticipate", "believe", "could", "estimate", "expect", "future", "intend", "may", "opportunity", "plan", "potential", "project", "seek", "will" and other similar words that involve risks and uncertainties.

Forward-looking statements inherently involve known and unknown risks, uncertainties and other factors that may cause the Company's actual results, performance and achievements to differ materially from any future results, performance or achievements. Relevant factors may include, but are not limited to, changes in commodity prices, foreign exchange fluctuations and general economic conditions, increased costs and demand for production inputs, the speculative nature of exploration and project development, including the risks of obtaining necessary licences and permits and diminishing quantities or grades of resources and reserves, political and social risks, changes to the regulatory framework within which the Company operates or may in the future operate, environmental conditions including extreme weather conditions, recruitment and retention of personnel, industrial relations issues and litigation as well as other uncertainties and risks set out in the announcements made by the Company from time to time with the Australian Securities Exchange.

Forward-looking statements are not guarantees of future performance and involve known and unknown risks, uncertainties, assumptions and other important factors, many of which are beyond the control of the Company, its directors and management of the Company that could cause the Company's actual results to differ materially from the results expressed or anticipated in these statements.

The Company cannot and does not give any assurance that the results, performance or achievements expressed or implied by the forward-looking statements contained in this announcement will actually occur and investors are cautioned not to place undue reliance on these forward-looking statements. The Company does not undertake to update or revise forward-looking statements, or to publish prospective financial information in the future, regardless of whether new information, future events or any other factors affect the information contained in this report, except where required by applicable law and stock exchange listing requirements.

Copper Equivalent Calculations

Copper equivalent grades have previously been calculated based on the parameters set out in New World's announcements to the ASX on 12 May, 3 August, 31 August, 22 September and 2 and 25 November 2020, and 18 January, 19 March, 8 April, 20 May, 21 June, 15 and 29 July, 16 August, 22 September, 13 October, 5 and 30 November 2021 and 20 January, 1 March, 20 April, 14 July 26 September, 11 October and 5 December 2022 and 18 March 2024.

New copper equivalent grades reported in this announcement have been calculated based on the metal prices that the Company assumed in its PFS into the development of the Antler Copper Project as announced to the ASX on 17 July 2024, namely: copper – US\$9,259/t, zinc – US\$2,712/t, lead – US\$2,205/t, silver – US\$25.00/oz and gold – US\$2,055/oz. Potential metallurgical recoveries have been included in the calculation of copper equivalent grades. These recoveries have been based on advanced metallurgical testwork that New World has conducted. This metallurgical testwork is continuing, but recoveries are estimated to be in the order of: copper – 94.4%, zinc – 94.7%, lead – 79.9%, silver – 77.0% and gold – 82.0%. New World believes that all elements included in the metal equivalent calculation have a reasonable potential to be recovered and sold.

The following formula was used to calculate the copper equivalent grade, with results rounded to one decimal point:

$$\text{Cu equiv. (\%)} = (\text{Cu\%} \times 0.944) + (\text{Zn\%} \times 0.947 \times \text{Zinc price/Copper price}) + (\text{Pb\%} \times 0.799 \times \text{Lead price/Copper price}) + (\text{Ag oz/t} \times 0.77 \times \text{Silver price/Copper price} \times 100) + (\text{Au oz/t} \times 0.82 \times \text{Gold price/Copper price} \times 100)$$

Table 1. November 2022 JORC Mineral Resource Estimate for the Antler Deposit above a 1.0% Cu-Equivalent cut-off grade (see NWC ASX Announcement dated 28 November 2022 for more information).

Classification	Tonnes	Cu (%)	Zn (%)	Pb (%)	Ag (g/t)	Au (g/t)	Cu-Equiv. (%)
Indicated	9,063,649	2.25	5.11	0.90	35.94	0.40	4.3
Inferred	2,371,673	1.55	4.46	0.85	21.32	0.17	3.3
Total	11,435,323	2.10	4.97	0.89	32.9	0.36	4.1

Note: Mineral Resources are reported inclusive of Ore Reserves

APPENDIX 1 –

JORC CODE 2012 EDITION, TABLE 1 REPORT

RECENT DRILLING AT THE ANTLER COPPER PROJECT

JORC Code, 2012 Edition – Table 1**Section 1: Sampling Techniques and Data**

(Criteria in this section applies to all succeeding sections)

Criteria	JORC Code Explanation	Commentary
Sampling Techniques	• Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. • In cases where ‘industry standard’ work has been done, this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information	• HQ diamond core samples have been obtained during drilling. • Core was logged and marked up for sampling by experienced geologists. Mineralised (and potentially mineralised) intervals of core were then cut in half (with a core saw), with half-core retained on site for further reference and the other half-core submitted to a laboratory for analysis.

Criteria	JORC Code Explanation	Commentary
Drilling Techniques	• Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).	• Diamond core was drilled from surface to the end of the hole. • HQ or NQ diamond core drilling was undertaken through the targeted mineralised horizon(s). • HQ diamond core diameter is 63.5mm. • NQ diamond core diameter is 47.6mm.
Drill Sample Recovery	• Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material	• Drill core recoveries were routinely recorded by the drilling contractors and subsequently cross-checked by the Company's geologists. • Recoveries were generally good. • There does not appear to be a relationship between sample recovery and grade. Recoveries were normal through the mineralized zone.
Logging	• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. • The total length and percentage of the relevant intersections logged	• Drill core was logged to industry standards, with logging suitable for Mineral Resource estimation.

Criteria	JORC Code Explanation	Commentary
Sub-Sampling techniques and sample preparation	• If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled.	• Drill core was halved with a core saw; with one half of the core sent to a laboratory for assay and the other half retained on site in ordered core storage trays for future reference. • Blanks begin and end each sample batch and duplicates or standards are included in every 10 samples submitted to the laboratory for analysis. • Sample preparation in advance of assay was ALS Tucson's Prep-31, and SGS Lakefield's standard sample preparation methodology.
Quality of assay data and laboratory tests	• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established	• Typical analytical techniques, including use of duplicates and blanks, have been adopted. • Assays have been determined using ALS Geochemistry's ME-ICP61a or ME-MS61 methods for base metals, silver and OG-62 for over limits; and Au-AA23 method for gold; or using SGS Canada's GC_ICP42C, GEICP40Q12, or GE_ICP40Q100 methods for base metals, silver and over limits; and GO FAA303, GOFAG30V, or FAG30V5 method for gold.

Criteria	JORC Code Explanation	Commentary
Verification of sampling and assaying	• The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data	• Analytical data have been incorporated into the Company's Project database. Significant intersections of mineralisation were then calculated by the Company's technical personnel.
Location of data points	• Accuracy and quality of surveys used to locate drillholes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	• Drill hole collars have been determined within 50cm using a hand-held GPS unit utilising the UTM NAD 83 Zone 12 datum and projection. Azimuth values are reported relative to true north. • Collar alignment is completed using a Reflex TN14 Gyro Compass. • Down-hole surveys were undertaken every 15m using an IMDEX OMNIx42Gyro. • A digital surface model generated by the Company in June 2022, accurate to 5cm, has been used to generate collar elevations and to verify the accuracy of historical drill collar elevations.
Data Spacing and distribution	• Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied.	• 100% of drill core is logged. Samples containing visible sulphide mineralisation and/or significant alteration are sent to a laboratory for assay. • Sample intervals through the visible sulphide mineralisation were generally 0.5m and no greater than 1.0m in length. • The sample spacing is suitable for use in Mineral Resource estimations. • No sample compositing has been applied. • Significant intersections of mineralisation were calculated by the Company's technical personnel.

Criteria	JORC Code Explanation	Commentary
Orientation of data in relation to geological structure	- Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. - If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	All holes completed to date for exploration purposes have been drilled as close to perpendicular to the geological horizon and/or structures that are interpreted to be hosting mineralisation as practicable, given there are topographic and property boundary limitations on where drill rigs can operate from.
Sample Security	The measures taken to ensure sample security	Drill core is being stored and processed within a secure workshop facility. Samples are regularly dispatched to a laboratory for analysis as they are processed.
Audits or reviews	The results of any audits or reviews of sampling techniques and data	Not undertaken.

Section 2: Reporting of Exploration Results

(Criteria listed in section 1 also apply to this section)

Criteria	JORC Code Explanation	Commentary
Mineral tenement and land tenure status	- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area	- In January 2020 New World entered into an option agreement that provided it the right to acquire a 100% interest in 2 patented mining claims (approximately 40 acres) that cover most of the Antler Deposit and 7 Federal mining claims (approximately 340 acres) that cover the area immediately to the west, south and east of the Antler Deposit. The terms of this agreement were summarized in an ASX announcement on 14 January, 2020. In October 2021, New World exercised its option, thereby taking 100% ownership of the 2 patented mining claims and surrounding Federal mining claims. New World's ongoing obligations are summarized in an ASX announcement dated 5 October 2021. - In December 2023 New World completed the purchase of a 100% interest in two parcels of mineral rights that cover a total of approximately 1,000 acres comprising: (i) 640 acres located immediately south of the Antler Deposit, which contains the Bullhorn Target; and (ii) 360 acres located several hundred metres due east of the Antler Deposit, which contains the Longhorn Target. A 3.0% net smelter return ("NSR") royalty is payable to the vendor (see NWC ASX Announcement dated 9 November 2023). In these two areas, the mineral and surface rights are "split" (i.e. the mineral and surface rights are held by different owners). The Company already holds an option to purchase 680 of the 1,000 acres of the surface rights that coincide with these mineral rights (see NWC ASX Announcement dated 3 March 2022). The remaining 320 acres of surface rights are managed by the Bureau of Land Management ("BLM"), a US federal government agency. - New World will be required to obtain local, state and/or federal permits to operate at the Antler Project. There is a long history of exploration and mining in the project area, so it is considered likely requisite permits will be obtained as and when they are required.

Criteria	JORC Code Explanation	Commentary
		The northernmost, deep, down-dip extension of the Antler Deposit lies beneath lands that were zoned “Wilderness” in 1990. New World has received legal advice that, in accordance with Federal mining laws that were established in 1872 (and continue in existence today), the Company has the right to mine these down-dip extensions as far north as the lateral projection of the end line of the boundary of the patented claim because they comprise the continuation of the outcropping Antler Deposit that was patented in 1894 (provided no surface infrastructure is constructed within the Wilderness area).
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	A summary of the history of previous exploration activities was included in an ASX announcement on 14 January 2020.
Geology	Deposit type, geological setting and style of mineralisation	The mineralisation at the Antler Copper Project comprises volcanogenic massive sulphide (VMS)-type mineralisation within Proterozoic metasedimentary and meta-volcanic rocks.
Drillhole Information	- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes: - easting and northing of the drillhole collar - elevation or RL (Reduced Level elevation above sea level in metres) of the drillhole collar - dip and azimuth of the hole - downhole length and interception depth - hole length. - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case	- Drill hole collar details are tabulated in this announcement. - Depths and lengths of intercepts discussed in this announcement are down-hole depths and lengths. - A long section in the announcement illustrates the location of the mineralisation intersected in these drill holes relative to the known mineralisation at the Project.

Criteria	JORC Code Explanation	Commentary
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually material and should be stated. • Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated	• Significant intercepts were calculated by length-weighted averaging. No maximum grade truncations (e.g. cutting of high grades) were applied. • Significant intersections of mineralisation in the drill holes reported in this announcement were calculated on a weighted-average basis by including assay results within continuously mineralised intervals that satisfied the following thresholds: >0.75% Cu and/or >1.0% Zn and/or >1.0% Pb, with no more than 1.32m of continuous internal dilution. Consideration was also given to whether potential mining operations are likely to target thicker, lower-grade intervals of mineralisation or whether select higher-grade intervals may eventually be targeted during potential mining operations. • Copper equivalent grades have been calculated based on the following assumed metal prices that the Company applied in its PFS into the development of the Antler Copper Project as announced to the ASX on 17 July 2024; namely: copper – US\$9,259/t, zinc – US\$2,712/t, lead – US\$2,205/t, silver – US\$25.00/oz and gold – US\$2,055/oz. Potential metallurgical recoveries have been included in the calculation of copper equivalent grades. These recoveries have been based on advanced metallurgical testwork that New World has conducted. This metallurgical testwork is continuing, but recoveries are estimated to be in the order of: copper – 94.4%, zinc – 94.7%, lead – 79.9%, silver – 77.0% and gold – 82.0%. New World believes that all elements included in the metal equivalent calculation have a reasonable potential to be recovered and sold. The following formula was used to calculate the copper equivalent grade, with results rounded to one decimal point: $\text{Cu equiv. (\%)} = (\text{Cu\%} \times 0.944) + (\text{Zn\%} \times 0.947 \times \text{Zinc price/Copper price}) + (\text{Pb\%} \times 0.799 \times \text{Lead price/Copper price}) + (\text{Ag oz/t} \times 0.77 \times \text{Silver price/Copper price} \times 100) + (\text{Au oz/t} \times 0.82 \times \text{Gold price/Copper price} \times 100)$

Criteria	JORC Code Explanation	Commentary
Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported. • If it is not known and only the downhole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	• All significant intersections of mineralisation in new drill holes reported in this announcement refer to down-hole thicknesses of mineralisation. Where true thickness is considered to be less than 90% of the down-hole thickness, an estimate of the true thickness is reported here. ○ ANT0139: ~75% ○ ANT0146: ~85%
Diagrams	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views	• A long section in the announcement illustrates the location of the mineralisation intersected in the recent drill holes relative to the known mineralisation at the Project.
Balanced reporting	• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results	• The Company has previously released to the ASX summaries of all material information in its possession relating to the Antler Project.
Other substantive exploration data	• Other exploration data, if meaningful and material, should be reported including (but not limited to) geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	• The Company has previously released to the ASX summaries of all material information in its possession relating to the Antler Project.

Criteria	JORC Code Explanation	Commentary
Further Work	• The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). • Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	• New World intends undertaking further drilling to test for extensions of thick high-grade mineralisation. • In line with the positive outcomes of a recent PFS, New World has commenced preparation of a Definitive Feasibility Study. • New World submitted an initial mine permit application to the federal government in January 2024. It intends progressively submitting a series of applications for requisite state and county permits during 2024 and early 2025. • New World will continue to utilize data collected in its exploration drilling to evaluate numerous targets at both its Antler and Javelin Projects, which provide opportunities for discovery of additional mineralisation at other “satellite” prospects, where mineralisation could be mined and transported to the processing plant it intends building at the Antler Project.
