

CRITICAL MINERALS DRILLING GRANT AWARDED FOR THE T55 DRILL TARGET, NSW

HIGHLIGHTS

- **\$80,000 NSW Government drilling grant has been awarded under the Critical Minerals and High-Tech Metals Exploration Program to drill the T55 Target**
- **The grant will contribute 40% of the cost of a 500m deep rotary mud and diamond core tail drill hole to test the large-scale Cu-Au porphyry “T55” Target**
- **Drilling permits received, land access agreements in place**
- **Drilling is planned for December 2025, subject to rig availability**
- **This program is fully funded with a recent successful \$2.5m placement to advance exploration activities**

“The recognition by the NSW Geological Survey of the targeting completed by project partner Nimrod Minerals and the Altitude technical team is very encouraging for our concept of a large-scale Cu-Au porphyry mineral system on the project at the T55 Target, 60km east of the main Byrock Project area.

Both teams are thrilled to have been awarded \$80,000 in funding towards drilling and look forward to drill testing our interpreted previously unrecognised NW segment of the Macquarie Arc.

This will be the 3rd drilling program in four months and is in line with Altitude’s pipeline strategy of unlocking shareholder value through testing for high-quality discoveries”

- Duncan Chessell, Managing Director

Altitude Minerals Ltd (**Altitude** or **Company**) (**ASX: ATT**) is very pleased to announce that the New South Wales (NSW) Government has awarded a co-funding grant of \$80,000 for the drill testing of the Cu-Au Porphyry T55 target. This target is part of Altitude’s Byrock Project in the interpreted Northern Macquarie Arc, where the Company also intends to commence drill testing the high-priority “Pipe” targets in November, as announced on 15 September 2025. On 11 February 2025, Altitude announced the Company had entered into an Option to Earn-in agreement with project owner Nimrod Resources, granting Altitude the rights to earn up to a 75% interest in the Project.

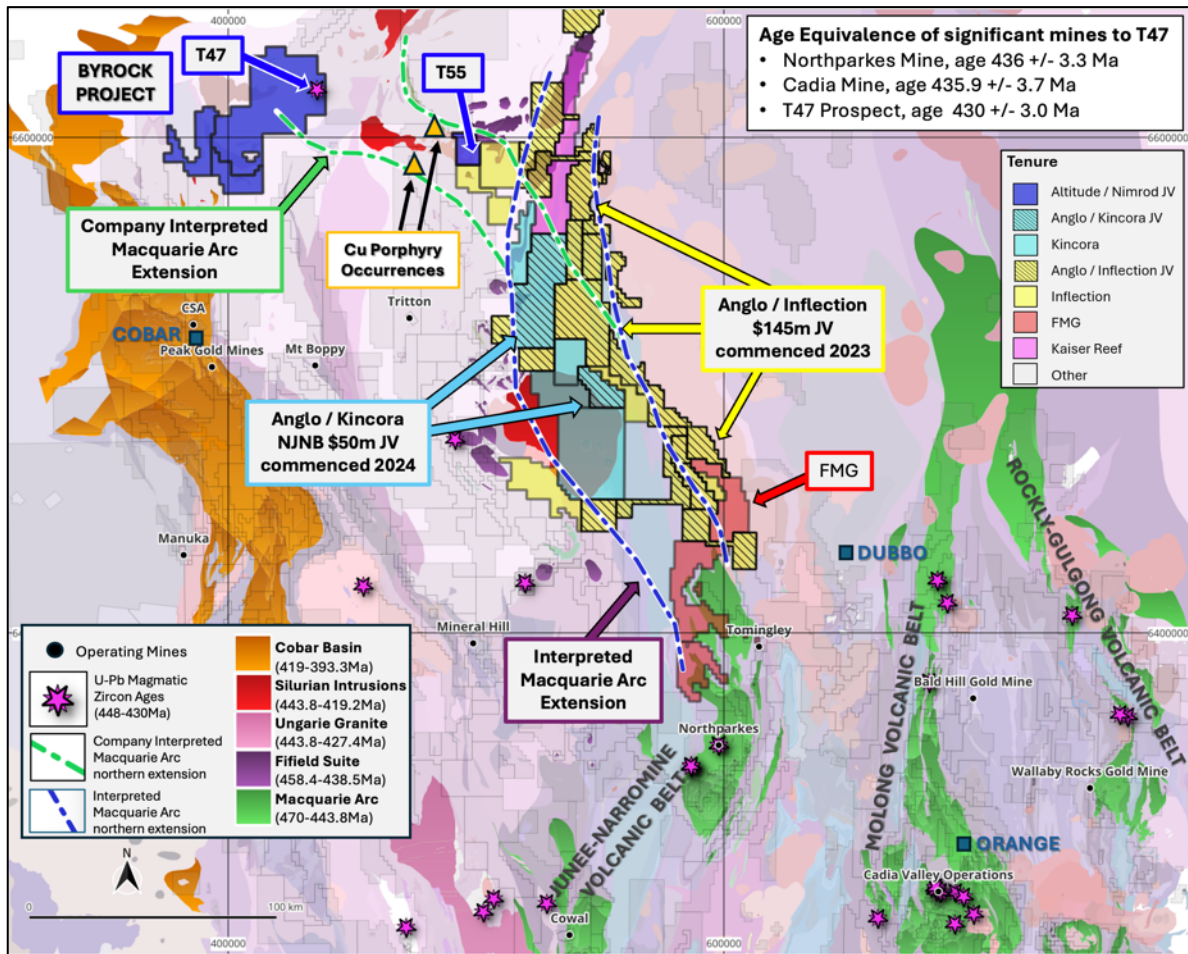

Figure 1 Location T55 and T47 (to be drilled in November) and Regional Tenement Map. Neighbours, operating mines, geochronology dates (magmatic U/Pb) of mineralisation events of significant regional deposits - background image solid geology. The Company's new interpretation** is the Macquarie Arc extends under cover to the northwest of the conventional North-South corridor across to the Byrock Project
